API calls: when, how, and where in the code

Short reference · 24 September 2026

There are two kinds of call. The browser only ever talks to our own server (/api/...). Our server is the only thing that talks to Sperto, because the Sperto api_key must never reach the browser. Typing into a field sends nothing: every call below fires on a button press or a page load.

Browser --(GET / POST /api/...)--> Our server --(POST only)--> Sperto

Sperto: the only two endpoints, POST only

Sperto's API is old and answers POST only. Both calls are POST with a raw JSON body and Content-Type: application/json (a form body or query string is silently ignored). The HTTP status means nothing there, so the answer is read from the body, in server/lib/sperto-response.js. Timeout 8 s (SPERTO_TIMEOUT_MS).

Endpoint	Body	Sent from
POST / api_get_details_of_customer.php	{ api_key, id, type } type = sales_manager_email sales_manager_login lead	server/lib/sperto.js:94 (spertoLookup)
POST /api_record_device_usage.php	{ api_key, device_id, lead_id, sales_manager_login, type: IN OUT, page_url }	server/lib/sperto-device- usage.js:90

```
// Staff / lead check
{ "api_key": "...", "id": "PDPL0349", "type": "sales_manager_login" }

// OUT on logout - page_url carries minutes per project (2 decimals)
{ "api_key": "...", "device_id": "1", "lead_id": "985038",
  "sales_manager_login": "PDPL0349", "type": "OUT",
  "page_url": [ { "Elena": 3 }, { "Alibaug": 4.5 } ] }
```

When each call fires

1 Sign in button (email or Sales ID)

Browser: POST /api/login src/lib/auth.js:80 -> server/routes/login.js:94
Sperto: POST get_details, type sales_manager_email or sales_manager_login
Sperto success -> signed in. Not found -> 401. Sperto down -> 503, not signed in.
On success: POST /api/session/device-usage, type IN (src/pages/LoginPage.jsx)
Sperto: POST record_device_usage, type IN, lead_id empty, page_url = the page URL

2 Every page load, and every 2 seconds while signed in

Browser: GET /api/session src/lib/auth.js:123 -> server/routes/session.js:20
Browser: GET /api/controls (2 s) src/lib/controls.js:70 -> server/routes/controls.js:25
No Sperto call. Checks the session cookie and force-logout.

3 Lead ID / phone search button

Browser: GET /api/leads?query= src/lib/leads.js:55 -> server/routes/leads.js:94
Sperto: POST get_details, type lead
Sperto says no -> session does not start. Sperto down -> our fallback answers.

4 Device chosen (Tab / TV / Kiosk / Laptop)

Browser: POST /api/leads (claim) src/lib/leads.js:121 -> server/routes/leads.js:163
No Sperto call. The IN already went at sign-in.

5 Dashboard opens

Browser: GET /api/inventory and GET /api/controls (blocked projects). No Sperto call.

6 Log out, 30 min idle, or force-logout (all run signOut)

Browser: POST /api/session/device-usage, type OUT
src/lib/session.js:62 -> server/routes/device-usage.js:84
Sperto: POST record_device_usage, type OUT, lead_id + minutes per project in page_url
(no presentation started -> lead_id empty, page_url = the page URL)
Browser: POST /api/logout src/lib/auth.js:150 -> server/routes/logout.js:20

Worth knowing

- The GET calls above go to our own server only. Nothing ever sends a GET to Sperto.
- IN / OUT are sent only when SPERTO_DEVICE_USAGE_API_KEY is set and the staff member's Sales ID is known. They never block the presentation: a failure is written to the server log.
- One IN per sign-in and exactly one OUT per sign-out, whichever way it ends (session.js keeps a flag).
- No Sperto keys set (local demo): the staff and lead checks use the built-in demo accounts and LEAD-1001 to LEAD-1005, and IN / OUT are skipped.

Keys: SPERTO_BASE_URL, SPERTO_API_KEY (staff and lead check), SPERTO_DEVICE_USAGE_API_KEY (IN / OUT).
Server-side only.
