

Hiranandani Dashboard

The flow at a glance

Two pages · the full version is Hiranandani-Flow.pdf · 23 September 2026

Three screens. One login is one customer. There is no “End Session” button — signing out is what closes a presentation, so it cannot be left half-ended whichever way the staff member leaves.

/login	->	/session/start	->	/dashboard
email or	->	Lead ID + device	->	VR tour + projects
Sales ID		(both Sperto-checked)		(timed per project)

Log out from any of them -> session closed, times sent to Sperto

1 Sign in

Email or Sperto Sales ID, no password. Sperto decides whether that identity is real.
Sperto down -> the built-in roster, so the demo always runs.

Admin / manager sign-in returns 403: reporting is out of scope this release.

2 Find the customer, pick the device

Lead ID or phone, checked against Sperto too. Refused -> the session does not start.
No Lead ID -> “Continue without a Lead ID” makes a walk-in record.
Tab / TV / Kiosk / Laptop, chosen rather than guessed. Sperto gets an IN call here.

3 The presentation

The 360° VR tour plays behind a rail of every project. Tapping one opens that project full-screen in this tab, so the header, the timers and Log out stay reachable.
A per-project clock runs; opening another project stops the first.

4 Log out — the only way out

Also happens by itself: 30 minutes idle, an admin force-logout, or the same account signing in elsewhere. Every exit runs the same code and sends exactly one OUT, carrying the per-project times.

What it is made of

Piece	What it is
Web app	React 19 + Vite, plain JSX, react-router-dom. Built to dist/.
API	Express 5 under /api. Signed httpOnly session cookie, checked on every call.
CRM	Sperto — staff check, lead check, and the device-usage log.
Store	None of our own: process memory + the browser tab. No database.
Hosting	Vercel (CDN + one function), or any Node host as one process.

Where the data lives

What	Where	Lives until
Activity log, session, per-project times	The browser tab's sessionStorage	the tab closes, or sign-out
Lead overlay — who claimed what	The API process's memory	that staff member signs out
Controls, added accounts, unit counts	The API process's memory	the process restarts

An empty store is the ordinary starting state, not an error — which is what makes a restart clearing it acceptable. Two consequences: treat a force-logout as immediate rather than lasting, and a manager sees only their own browser's log.

What reaches Sperto

```
OUT, at logout:
  page_url: [ { "Elena": 8 }, { "Alibaug": 15 } ]  <- their own field
```

That array is the only place the times go - nothing beside it.
Their host answers 200 for a rejection and 500 for a success, so
nothing branches on the status - every answer is read out of the body.

Time is measured, not inferred: only projects actually opened are reported, reopening adds rather than duplicates, two never run at once, a backgrounded tab accrues nothing, and the project on screen at logout still counts.

Running it

```
npm install && cp .env.example .env.local  # put a SESSION_SECRET in it
npm run dev      # app :3000, API :3001    npm test    # 70 tests
npm run build && npm start                  # one process, :3001
```

SESSION_SECRET is the only required variable. Without Sperto's keys, sign-in and lead lookup fall back to the built-in accounts and LEAD-1001 ... LEAD-1005 — and turning Sperto on turns those demo customers off.

Still open with the client

- Does their parser accept page_url as an array of { project: seconds }? It is the only field the times are in.
- The real device_id per device type — Tab / TV / Kiosk / Laptop are a placeholder 1 / 2 / 3 / 4.
- Each staff member's Sperto login code; without one, that account skips the device-usage call.
